

Hook Document - Trump Tariff Announcements Through Social Media and Their Effect on the S&P500

A Case Study Designed by Colin Sartori

Scenario

You are an intern for the Wall Street Journal. There have been articles published in the past that highlight the effect that President Trump's tariff announcements have on the stock market.

Your manager heard that you are interested in this topic and have some skills in data science and statistics. She has asked you to provide a draft article on her desk by the end of the week with analysis focused on how daily returns change and how the intraday volatility changes when Trump posts about tariffs. You see a future for yourself here at the WSJ, and want to make a good impression. You have heard that she is a big fan of graphs...

Mission

Conduct analysis of recent financial data, filtering days into groups based on whether or not Trump posted about Tariffs. Calculate the daily return and estimate the intraday volatility to report on the effect of Trump's tariff announcements. Use statistical tests to determine if there are any significant differences. Report findings clearly to interested parties.

Deliverable

You will write a short article to confirm or deny the recent theory that Trump's posts on social media about tariffs negatively affect the market. The article should be written so that an investor reading it will be able to determine whether or not to include this factor in their overall model for the market.
